Czech Republic

Václav Rovenský and Ján Béreš

Kocián Šolc Balaščík

1 Policy and law

What is the government policy and legislative framework for the electricity sector?

The electricity sector in the Czech Republic, as an energy sector subsystem, is regulated by a range of legal regulations of different legal power. The conditions for doing business, regulation and public administration in the energy sectors are set forth in Act No. 458/2000 Coll on conditions for doing business and for public administration in the energy sectors (Energy Act). Act No. 406/2000 Coll on energy management (Energy Management Act) sets forth measures for increasing the effectiveness of the use of energy and obligations of natural persons and legal entities, as well as rules for drafting the State Energy Concept, Regional Energy Concept and National Programme for Energy Saving and for Utilisation of Renewable Energy Sources. It also sets forth requirements for the ecological design of energy appliances. Act No. 180/2005 Coll on promotion of electricity generation from renewable sources (Alternative Energy Act) extensively covers generation from renewable sources. The Czech Republic has implemented secondary EC legislation in the above regulations, including Directive No. 2003/54/EC concerning common rules for the internal market in electricity and repealing Directive No. 96/92/EC and Directive No. 2001/77/EC on the promotion of electricity produced from renewable energy sources in the internal electricity market.

In addition to EC Regulation No. 1228/2003 on conditions for access to the network for cross-border exchanges in electricity, electricity cross-border exchanges are governed by the Energy Regulation Office (ERO) Decree No. 541/2005 Coll, mentioned below. The ERO, as the energy regulation public authority, issues decrees and decisions on the basis of the powers delegated thereto in the Energy Act. The most important decrees among the wide scale of regulations are Decree No. 541/2005 Coll on the electricity market rules, the principles for setting the prices for activities of the Electricity Market Operator (EMO) and on implementing some other regulations set forth by the Energy Act, Decree No. 475/2007 Coll, implementing some of the regulations set out by the Alternative Energy Act, and Decree No. 426/2005 Coll on details regarding the energy sectors business licensing. The Ministry for Industry and Trade (MIT) issues decisions and decrees within the powers delegated thereto by the Energy Act.

Electricity policy in the Czech Republic closely follows EU energy policy. Apart from the Energy Act, Energy Management Act and the Alternative Energy Act, Czech electricity policy is expressed in the State Energy Concept (SEC), which constitutes a strategic document with a 30-year outlook. It determines the scope of energy management in accordance with the necessities of economic and social development and environmental protection. The basic priorities for energy sectors set forth in the SEC are independence, security and sustainable development. The SEC was elaborated on by MIT pursuant to the

Energy Management Act and approved by the Czech government in 2004, and the fulfilment of the scope, priorities and tools set therein is reviewed by the MIT periodically every three years, when MIT informs the government of its conclusions. The SEC is an expression of state responsibility for the creation of conditions for a reliable and secure supply of electricity on a long-term basis and for acceptable prices, which shall not endanger the environment and shall comply with the principles of sustainable development.

Once a year, the EMO submits a report to the MIT and the ERO on the anticipated development of the electricity market and future electricity consumption, and also predicts how this consumption will be covered.

2 Organisation of the market

What is the organisational structure for the generation, transmission, distribution and sale of power?

The electricity market in the Czech Republic is composed of the following participants defined in the Energy Act: electricity producers (EPs), the transmission system operator (TSO), distribution system operators (DSO), the EMO, electricity traders (ETs) and end-customers (ECs).

All the activities at the electricity market, namely, electricity generation, transmission, distribution, trading and market operation, are subject to licensing. Licences are granted by the ERO. The licences for transmission and market operation are exclusive. All licences, except for trading (five years) and market operation (25 years), are granted for a period not exceeding 25 years. Licences are not necessary, for example, for distribution of electricity to tenants (of apartments or offices) by the building owner.

The Energy Act sets out the implementation schedule for the complete liberalisation of the electricity market. The electricity market was opened in several progressive steps, which took place from 2002 until 2006. Since 1 January 2006, when the last group of customers – households – became authorised customers and obtained the right to elect the electricity supplier, the market has become fully liberalised. Only activities of a monopoly-like nature remain regulated, such activities being transmission and distribution of electricity and activities related to ensuring the electrical grid stability both from technical and commercial point of view (for example, prices of services provided by the EMO are regulated by the ERO).

ČEPS, a.s. (CEPS), is the only TSO operating the transmission grid in the Czech Republic (consisting of 400kV, 220kV and selected 110kV wires). CEPS is responsible for transmission of electricity through the transmission grid, as well as for development of the grid, and for providing system services to ensure a secure and reliable operation.

Distribution of electricity (110 kV voltage level and lower) is provided by three regional DSOs with more than 90,000 customers;

their facilities are connected directly to the transmission system. Pursuant to Directive No. 2003/54/EC and the implementation legislation (namely, the Energy Act), the ‘unbundling procedure’ took place; since 1 January 2007, DSOs with more than 90,000 ECs could not simultaneously be the holders of licences for electricity generation, electricity transmission and electricity trading. As of 31 December 2007, there were other 277 local DSOs connected to the regional DSOs. These DSOs distribute electricity in the areas set forth in the distribution licences.

ERO Decree No. 404/2005 Coll on content of economical data and ERO Decree No. 150/2007 Coll on procedures for regulation of prices in energy sector stipulate the structure of prices for electricity in accordance with Act No. 526/1990 Coll on prices. The price of electricity for the ECs, including households, is composed of regulated and non-regulated components. The regulated components include the prices for transmission and distribution of power to the ECs, system services, contribution for promotion of renewable sources energy, cogeneration payment and also the contribution for generation from secondary electricity sources. The EMO’s services, consisting of assessment, clearing and settlement of the imbalances, as well as organisation of the day-ahead market, are also included in the regulated part of the price.

Production, supply and business activities connected with power supply to the ECs are fully subject to market mechanisms. Until 2007, electricity was traded via bilateral agreements between the individual electricity market participants. Since 2007, when the Prague energy stock exchange (PXE) was established, futures – monthly base load, quarterly base load, annual base load and monthly, quarterly and annual peak load – are traded on the PXE. Day-ahead and intraday trades also take place on the PXE. Information about price determination is thus more accessible to the public, in particular via the internet. Before the PXE was established, suppliers of power to the ECs acquired and sold power via auctions and day-ahead trades, and spot operations constituted only 2 per cent of the total power trading. Due to PXE’s activities, the price for power is now constituted with the demand–supply mechanism.

The PXE’s regulated market is organised and controlled pursuant to Act No. 229/1992 Coll on commodity stock exchanges. Trading on the PXE is allowed only to the licensed ETs, which are also subject to clearing performed by the EMO. The possibility of trading on the PXE is established on the basis of a contract between the ETs and PXE. Trades can be concluded only in electronic form and in euros; trading takes place every business day.

The EMO is a joint stock company established by the state and the state must keep at least 67 per cent stake in the EMO’s registered capital. It is the holder of an exclusive licence for electricity market operation. The EMO’s main activity in the electricity market is the organisation of the short-term and intraday trading, processing and publishing data for settlement of imbalances between the contracted and measured values of supply and consumption of power. It is also responsible for ensuring the real values of supplies and takeover of electricity for the electricity market participants. It organises the balancing market for regulation energy in collaboration with the TSO and performs certain statistical and other duties. The EMO is also responsible for certain activities related to the limitation of the greenhouse gas emissions (National Registry for Emissions Trading).

On the basis of contracts on settlement of imbalances, the EMO performs the valuation of contracted and actual supply and takeover of electricity and performs the assessment, settlement and clearing of the imbalances. This activity has a monopoly character and the prices for such services are therefore regulated.

Regulation of electricity utilities – power generation

3 Authorisation to construct and operate generation facilities

What governmental or administrative authorisations are required to construct and operate generation facilities?

As a first step, certain contemplated power plants would be subject to the procedures set forth in Act No. 100/2001 Coll on environmental impact assessment (EIA).

Next, the state authorisation for power plant construction must be obtained. Pursuant to the Energy Act, construction of generation facilities with the total installed capacity equal to or above 30MW requires a state authorisation issued by the MIT. Total installed capacity includes all installed capacities of generation facilities as measured in the point of connection to the electricity network. The authorisation is issued upon assessing:

- utilisation of fuel or other sources;
- energy effectiveness;
- influence on the secure and reliable operation of the electricity network;
- financial conditions fulfillment;
- impact on the environment and air – EIA;
- energy sources effectiveness and economy; and
- public health and safety protection.

As with any other building, construction of generation facilities in the Czech Republic is generally regulated by Act No. 183/2006 Coll (Construction Act). As a next step, the zoning permit, construction permit and finally the permit for use of the completed generation facility must be issued. For obtaining the aforementioned three permits under the Construction Act, consents must be issued by the relevant authorities that protect public interest, for example, the water, air, soil, and health protection authority and many others.

On generation, transmission, distribution and trading licensing, please see question 2. There is no special licence required by energy-related legislation to operate a generation facility.

4 Interconnection policies

What are the policies with respect to interconnection of generation to the transmission grid?

The conditions for interconnection of generation to the transmission grid are set in the Transmission System Code elaborated by CEPS and approved by the ERO. CEPS must connect any generator to the transmission grid, provided that it meets all the conditions set by the Transmission System Code and the relevant legislation, and provides a request to CEPS to that extent, unless there is a demonstrable insufficiency of the transmission device capacity or the reliable operation of the transmission grid is jeopardised. The technical details for interconnection are also set out in the operation instructions of the TSO control centre.

The conditions set forth in the Transmission System Code are set forth as the technical, construction and operation requirements for interconnection. The interconnection fee is regulated by the ERO.

5 Alternative energy sources

Does the government policy or legislation encourage power generation based on alternative energy sources such as renewable energies or combined heat and power?

Yes, the Alternative Energy Act regulates promotion of power generation from renewable energy and implements Directive No. 2001/77/EC on the promotion of power generation from renewable energy sources in the internal electricity market. The cogeneration of power and heat is promoted by the Energy Act.

Non-fossil energy sources are considered to be renewable, namely, wind, solar radiation, geothermal, water, soil, air, biomass, trash dump gas, sludge gas and biogas energy, as well as from mine gas from closed mines.

Power generated from cogeneration and renewable energy sources is to be purchased in preference and there are special payment surcharges for power so generated.

Regulation of electricity utilities – transmission

6 Authorisations to construct and operate transmission networks

What governmental or administrative authorisations are required to construct and operate transmission networks?

The operation of transmission networks in the Czech Republic is performed in the public interest. The licence for transmission of electricity is issued by the ERO as an exclusive licence for the entire territory of the Czech Republic. The transmission networks operator is not allowed to hold licences for electricity trade, distribution and generation. Currently, the licence-holder for operation of transmission networks in the Czech Republic is CEPS, which is responsible for transmission of electricity at the transmission networks level, as well as for the development of the transmission system and for providing the system services necessary for ensuring secure and reliable operation of the electricity network. CEPS is controlled by the state (directly by 49 per cent shareholding and indirectly by the 51 per cent shareholder, Osinek, a.s., a company owned by the state).

The operation and development of the transmission grid is fully under state control and performed in public interest.

7 Eligibility to obtain transmission services

Who is eligible to obtain transmission services and what requirements must be met to obtain access?

Transmission services are provided in public interest. Access to the transmission grid is regulated and the right of regulated access to the transmission services (that is, the right to use transmission services under the conditions set by the Energy Act and for regulated prices set by the ERO) is granted to all entities that hold the licence for power generation, distribution or trading. Transmission services shall be granted to anybody who requests such services and fulfils the statutory conditions and the conditions set by the Transmission System Code, unless there is a demonstrable insufficiency of the transmission device capacity or the reliable operation of the transmission grid would be so jeopardised.

The transmission services are provided based on a contract on transmission of electricity concluded between the TSO and EP, ET or any authorised customer (any EC), and such entity undertakes to pay the regulated price.

8 Government incentives

Are there any government incentives to encourage expansion of the transmission grid?

No, the transmission grid is operated and developed by a state controlled company on the basis of an exclusive licence.

9 Rates and terms for transmission services

Is there any tariff or other regulation regarding the rates and terms for the provision of transmission services?

The prices for provision of transmission services are regulated by the ERO on the basis of Act No. 526/1990 Coll on prices. The ERO issues decrees and price decisions to that extent; currently ERO

Decree No. 150/2007 Coll on procedures for regulation of prices in energy sector is effective. The actual prices for 2008 are determined by ERO Price Decision No. 9/2007.

The Energy Act and other legislation issued on the basis of the Energy Act set forth the terms for provision of the transmission services. The technical details for provision of the transmission services are set in the Transmission System Code issued by CEPS.

10 Entities responsible for assuring reliability

Which entities are responsible for assuring reliability of the transmission grid and what are their powers and responsibilities?

CEPS, as the transmission grid operator with an exclusive licence, is responsible for assuring transmission grid reliability. It is also responsible for the development of the transmission grid and for provision of transmission services. It manages the electricity flow in the transmission grid also with respect to the transmission of power between the interconnected grids of other countries in cooperation with the distribution grid operators. It is responsible for ensuring the grid support services on the transmission system level.

CEPS is not allowed to hold the licence for electricity trading, distribution and generation.

The powers and responsibilities of CEPS are set forth in the Energy Act. It is allowed, among other things, mainly to acquire support services and electricity for covering losses of electricity in the transmission grid and for its proper use. CEPS may purchase electricity abroad for preventing emergency and failure states. CEPS may restrict or suspend the power supply to customers in certain circumstances and modify or suspend power supply from generators, as well as import power from abroad or export power in order to ensure reliable transmission grid operation. CEPS is also allowed to install and operate transmission grid facilities on third-party land under conditions stipulated by law.

CEPS has many duties, among others things, interconnecting anyone who fulfils the conditions for connection and ensuring non-preferential treatment for transmission of electricity to any party in the electricity market. In addition, CEPS must establish and maintain a technical control centre, issue the Transmission System Code and ensure for measuring and assessment thereof in the transmission grid. The Energy Act sets forth other particular duties of CEPS.

In general, CEPS is responsible for all activities necessary for the provision of transmission services and its powers are determined in the Energy Act mainly in connection with the necessity for a due and reliable provision of the transmission services and other related activities.

Regulation of electricity utilities – distribution

11 Authorisation to construct and operate distribution networks

What governmental or administrative authorisations are required to construct and operate distribution networks?

The construction and operation of a distribution grid is performed in the public interest and only on the basis of a licence granted by the ERO for a certain area, defined in the licence. Once such licence has been granted, it is possible to develop the distribution grid only on the basis of the procedures set forth in the Construction Act and the Energy Act and related legislation, including the Transmission System Code. Construction and operation of the distribution network must also comply with the particular distribution licence.

12 Access to the distribution grid

Who is eligible to obtain access to the distribution grid and what requirements must be met to obtain access?

Anyone who complies with the conditions set by the Energy Act, its related legislation and the Distribution Grid Operation Rules and requests for connection, will be allowed to connect to the distribution grid by the DSO. The DSO may require the applicant to provide a feasibility study for connection. After the conditions have been complied with, the DSO is obliged to conclude an agreement on connection to the distribution grid. The connection should be also communicated in advance with the relevant municipalities where the connection wires are to be placed.

Distribution Grid Operation Rules are elaborated by DSOs, must be in compliance with the Transmission System Code and are subject to the ERO approval.

13 Rates and terms for distribution services

Is there any tariff or other regulation regarding the rates or terms for the provision of distribution services?

The distribution services are provided in the public interest and therefore the DSOs must comply with the Energy Act and its implementation legislation for assuring the reliability of distribution services. The price for distribution services for 2008 is regulated by the ERO pursuant to its Price Decision Nos 9/2007 and 10/2007.

The distribution services are provided based on a contract on distribution services.

Regulation of electricity utilities – sales of power**14 Approval to sell power**

What governmental or administrative authorisations are required for the sale of power to customers and which authorities grant such approvals?

A licence for electricity trading is necessary in order to sell power (with certain exceptions – see question 2). It is issued by the ERO for a maximum period of five years. The conditions for granting licences in the energy sector are set in the Energy Act and the ERO implementation Decree No. 426/2005 Coll, setting forth details for granting licences in the energy business. In order for a natural person to obtain a licence, he or she must be at least 21 years of age and legally competent, of a good moral character and have a special qualification (or nominate a representative with such qualification). Where the applicant is a legal entity, the members of the entity's statutory body must fulfil the conditions set forth for the natural person and a specially qualified representative must be nominated. The applicant must also provide evidence of the necessary financial and technical conditions, which include also submitting a business plan for the next five years.

15 Power sales tariffs

Is there any tariff or other regulation regarding power sales?

The sale of electricity is regulated by the Energy Act and by ERO. Currently, Decree No. 404/2005 Coll and Decree No. 150/2007 Coll regulate the manner of setting the electricity sale tariffs. The price for electricity is divided into two parts: the regulated part (transmission, distribution, system services, etc) and non-regulated part (the sale of the actual power to the ECs). Most power sale contracts are based on the 'take or pay' principle.

Electricity customers are divided into different groups pursuant to the manner of power utilisation and the voltage level. The two main groups are EPs and ETs, and ECs. The ECs are further divided

into business persons that take over the electricity at HV level, business persons that take over the electricity at LV level, and households; each group is granted a different price.

There is a wide scale of contracts on the electricity market. A typical contract for sale of power to the EC is the contract on associated services of electricity supply through which the EP or ET supplies both power and related services to the EC; in such instance, the price is made up of the unregulated price for power and the liability of the provider for imbalances, and the regulated price for distribution and other services. The other types of contracts regulated by the Energy Act include the contract on provision of transmission services or distribution services or the contract on provision of support services.

Contracts available in power trading include contracts on access to the short-term electricity market, on access to the balancing market with regulation electricity and on supply of regulation energy.

16 Public service obligations

To what extent are electricity utilities that sell power subject to public service obligations?

First, as previously mentioned, DSOs and TSOs must, broadly speaking, connect anyone unless it is not technically possible to do so.

Second, any EP is required to offer operationally and commercially redundant generation capacities, upon instructions of the TSO and DSOs, for the purposes of ensuring the security and reliability of the electricity system operation and for prevention and solution of emergency states. In case of a state of emergency declared by CEPS, the EPs must follow the instructions of the electricity dispatchings, including mandatory generation, in order to eliminate the consequences of the state of emergency.

The last-instance suppliers are defined by the Energy Act as electricity-trading licence-holders selected by the ERO, which are obliged to supply electricity to households and to minor customers, upon request, for prices set by the ERO.

Regulatory authorities**17 Policy setting**

Which governmental or administrative authorities determine regulatory policy with respect to the electricity sector?

The primary legislation is adopted by the Czech parliament (the draft laws are usually prepared and submitted by the government) and the public authority bodies adopt secondary acts for implementation of the primary one; in case of the Energy Act, such authorities are the ERO and the MIT.

The entities with partial regulatory powers, but not being public authorities, are the EMO (which issues the commercial terms and conditions of the EMO), the LSO (which issues the Transmission System Code), and the DSOs (which issue the distribution system operation rules).

18 Scope of authority

What is the scope of each regulator's authority?

As regards the public authorities involved in the electricity sector, the MIT is involved in regulation of the energy sector and in elaboration of the SEC. In the electricity sector, it mainly issues state authorisations for the construction of new electricity sources and the state authorisations for construction of direct lines pursuant to the Energy Act. The MIT is also involved in fulfilling the obligations ensuing from the international agreements.

The ERO mainly determines regulated electricity prices, supports economic competition in the energy sector, promotes utilisation of

renewable and secondary sources and protects consumers' interests in the energy sector segments where competition is not possible. The ERO supervises and creates conditions for satisfaction of all reasonable requirements for supply of electricity. It also exercises its powers pursuant to the EC Regulation No. EC/1228/2003 on conditions for access to the grid for cross-boarder electricity exchange.

There are also other public authorities that are involved in the electricity sector, mainly the State Energy Inspection (SEI), which oversees the compliance with obligations set forth by the energy regulations. The Ministry of Environment is involved in environment protection, as well as the Czech Environment Inspection. The EMO as a private entity has an exclusive licence for performing the activities of the market operator.

19 Establishment of regulators

How is each regulator established and to what extent is it considered to be independent of the regulated business and of elected officials?

The MIT is the supreme state administration body and was established by law. It issues the implementation legislation pursuant to the Energy Act, while respecting the policy of the government and internal regulations. The head of the MIT, the minister, is a member of the Czech government.

The ERO is also a supreme state administration body, which was established pursuant to the Energy Act and Act No. 2/1969. It is independent to the extent that it issues the implementation legislation within the bounds of its powers, nevertheless it is obliged to respect the government's policy and internal regulations.

CEPS was established in 1998 as a joint stock company by CEZ, a.s. (the largest electricity producer in the Czech Republic), as the formation of an individual transmission grid operator was required by EC Regulation No. 96/92/EC (see question 10).

The EMO was established in 2001 as a joint stock company, owned 100 per cent by the state on the basis of the Energy Act (see question 2).

The DSOs are private entities with certain powers and responsibilities granted by law.

In connection with the above it is important to note that the Transmission System Code, Distribution System Operation Rules and distribution tariffs are approved by the ERO. The EMO's terms and conditions are also approved by the ERO.

20 Challenge and appeal of decisions

To what extent can decisions of the regulator be challenged or appealed, and to whom? What are the grounds and procedures for appeal?

As a rule, the procedures for issuing individual decisions under the Energy Act and the Act on Energy Management are subject to regulations set by the Administration Procedure Code (Act No. 500/2004 Coll, as amended).

The Administration Procedure Code, among other things, determines the rules for initiation, course and termination of the administration proceedings, and also determines the possible remedies against decisions of the relevant bodies. In addition, the Code of Administrative Court Procedure determines also the full jurisdiction of the Czech courts for the administration matters, so also the remedy to the independent court is possible.

Decrees or decisions of a regulatory body that are generally binding may be modified only by the authority that issued such decree or decision. Alternatively, such decision may be abolished for conflicts with constitution laws, primary laws or international treaties.

Acquisition and merger control – competition

21 Responsible bodies

Which government bodies have the authority to approve or disapprove mergers or other changes in control over businesses in the sector or acquisition of utility assets?

The Office for the Protection of Competition (OPC) is the central state administration authority entrusted with protection of competition in the Czech Republic and is responsible for approving the concentration of undertakings. If trade between European Community member states can be affected, the European Commission may have the authority instead of the OPC.

22 Review of transfers of control

What criteria and procedures apply with respect to the review of mergers, acquisitions and other transfers of control? How long does it typically take to obtain a decision approving or disapproving the transaction?

In cases of concentration without community dimension, the provisions of Act No. 143/2001 Coll on protection of economic competition shall apply.

The concentration of undertakings is subject to the consent of the OPC, provided that:

- the net turnover of all concentrating undertakings achieved in the last financial year in the Czech market is higher than 1.5 billion Czech crowns, and at least two of the concentrated undertakings achieved a net turnover that exceeds 250 million Czech crowns in the Czech market in the last financial year; or
- the net turnover achieved in the last financial year exceeds 1.5 billion Czech crowns in the Czech market and the net turnover achieved worldwide by another concentrating company in the last financial year exceeds 1.5 billion Czech crowns.

The procedure of assessment of the OPC is initiated upon proposal. Since the initiation of the procedures is published in the Commercial Bulletin, objections may be raised. In case the OPC has no concerns with respect to the proposed concentration, the proceedings shall be finished by approval within 30 days. In certain cases the OPC may request the Commission to perform the assessment. In case the OPC does not issue the decision within five months of submitting the proposal, the consent is deemed to be issued.

The concentration has a Community dimension where either:

- i the combined aggregate worldwide turnover of all the undertakings concerned is more than €5,000 million and the aggregate Community-wide turnover of each of at least two of the undertakings concerned is more than €250 million and none of the undertakings concerned achieves more than two-thirds of its aggregate Community-wide turnover within one and the same member state; or
- ii the thresholds set forth in point (i) are not met, but:
 - the combined aggregate worldwide turnover of all the undertakings concerned is more than €2,500 million;
 - each of at least three member states, the combined aggregate turnover of all the undertakings concerned is more than €100 million;
 - in each of at least three member states included for the purpose of the second point above, the aggregate turnover of each of at least two of the undertakings concerned is more than €25 million; and
 - the aggregate Community-wide turnover of each of at least two of the undertakings concerned is more than €100 million and none of the undertakings concerned achieves more than two-thirds of its aggregate Community-wide turnover within one and the same member state.

Update and trends

Currently, an extensive amendment to the Energy Act is being discussed within the Czech parliament. This is due to several reasons – upcoming deadlines set forth by European Directives for implementation of its provisions into national legislation, as well as the necessity of repealing the outdated provisions of the Energy Act related

primarily to opening of the electricity and gas markets and unbundling requirements, which have already been implemented. Also, the provisions of the Energy Act will generally be made more 'user-friendly', for example, procedures for the granting of energy related licences will be simplified.

Where one of the above conditions is satisfied, the European Commission must assess the proposal for concentration pursuant to EC Regulation No. 139/2004, and may refer the case to the OPC.

23 Prevention and prosecution of anti-competitive practices

Which governmental or administrative authorities have the power to prevent or prosecute anti-competitive or manipulative practices in the electricity sector?

The OPC and the European Commission are responsible for prosecution and preventing manipulative and anti-competitive practices. The SEI is responsible for control of fulfillment of the price regulations in the electricity sector and may impose sanctions for breach of the obligations of the electricity sector participants. The ERO is also responsible for supervision of power prices set between the market participants.

24 Determination of anti-competitive conduct

What substantive standards are applied to determine whether conduct is anti-competitive or manipulative?

The standards are determined directly in articles 81 and 82 of the European Community Treaty. All agreements between undertakings, decisions by associations of undertakings and concerted practices that may affect trade between member states, and that have as their object or effect the prevention restriction or distortion of competition within the common (EC) market, and also abuse of a dominant position, are determined as anti-competitive conduct.

The Act on Protection of the Economic Competition determines the anti-competitive conduct similarly to the European Community Treaty as all agreements between the undertakings, decisions of associations of undertakings and concerted practices that affect or may affect the economic competition, and the abuse of a dominant position.

25 Preclusion and remedy of anti-competitive practices

What authority does the governmental body (or bodies) have to preclude or remedy anti-competitive or manipulative practices?

All agreements between undertakings, decisions by associations of undertakings and concerted practices that lead or may lead to effects on the competition are generally forbidden and invalid unless the law sets forth otherwise or the OPC allows an exception by decree. The OPC has the authority to withdraw the exception in case the agreement concerned does not meet conditions stipulated by law.

The OPC has the power to initiate an investigation upon receipt of a complaint or at its own instigation. It can request information necessary for conducting the investigation from any entity operating on the market or from state bodies (for example, ERO). Upon completion of proceedings, the OPC may issue a decision prohibiting further performance of an anti-competitive agreement or practice or a decision prohibiting to continue abusive behaviour. The OPC is

further empowered to impose fines or remedial measures. It is also allowed to apply articles 81 and 82 of the European Community Treaty.

International**26 Acquisitions by foreign companies**

Are there any special requirements or limitations on acquisitions of interests in the electricity sector by foreign companies?

There are no special limitations for acquisitions of interests in the Czech companies, except as mentioned in question 2 with respect to CEPS, EMO and the DSOs.

27 Cross-border electricity supply

What rules apply to cross-border electricity supply, especially interconnection issues?

The conditions of access for the cross-border electricity trading are currently set forth in the EC Regulation No. 1228/2003, on conditions for access to the cross-border electricity market system, as well as in the Transmission System Code and ERO Decree No. 541/2005 Coll on electricity market rules. The trade can be effectuated only up to the amount of the capacity reserved on the basis of auctions organised by the TSO, or on the basis of the transmission capacity obtained by assignment of the reserved cross-border transmission capacity from another person or entity. The capacity is assigned on the basis of price offers of the auction participants. The lowest offered price wins and the assignment becomes effective at the moment of payment of the auction price in the term determined in the auction rules. The realisation cross-border trade scheme must be submitted to the TSO for utilisation of the reserved capacity and the capacity is reserved only until the expiry of the term determined for submitting the realisation schemes. The part of the capacity reserved and not utilised shall be offered to the daily auctions participants.

Pursuant to the aforementioned ERO Decree on electricity market rules, the regulated access to the transmission grid and to the distribution grid can be effectuated on the basis of an agreement on cross-border electricity transmission concluded with the TSO; the TSO undertakes to transport certain amount of electricity abroad or from abroad or from one transmission grid to another in such agreement. An agreement with the EMO on settlement of eventual imbalances must also be concluded.

Transactions between affiliates**28 Restrictions**

What restrictions, if any, exist on transactions between electricity utilities and their affiliates?

The transactions within groups of entities are generally restricted by the regulations on business groups set forth in the Czech Commercial

Code (Act No. 513/1991 Coll) and Czech tax laws. Pursuant to these laws, all transactions within business groups and with affiliates must be at arm's length and must comply with certain formal requirements.

29 Enforcement and sanctions

Who enforces the restrictions on utilities dealing with affiliates and what are the sanctions for non-compliance?

Company shareholders or creditors apply for enforcement of the restrictions in this respect, and the Czech courts adopt the relevant decisions. Certain activities, which are in conflict with mandatory provisions of law, can even be invalid and the damage caused thereby must be reimbursed. The remedies thus have prevalently a private law nature.
